

Process Safety Management

In 2020, Chemicals business has started to conduct the Process Hazard Analysis Revalidation. The results gained from the hazard analysis and hazard control measures were reviewed to find a linkage in order to ensure the holistic risk management. The process focused on high risk activities through an involvement of operational workers to enhance their understanding and enable them to comply with the risks control measures correctly. They were also encouraged to report the abnormality so that effective management can be done with leading indicators, e.g. Process Safety Alarm and Process Safety Near Miss.
